farmers buy that prevailed in a specified base period. This concept was first defined by the Agricultural Adjustment Act of 1933. The parity price formula is not a comprehensive measure of the economic well-being of farmers, nor does it measure cost of production, standards of living, or income parity. The parity price formula is based on price relationships, and reflects only one component of cost of production and income.

<u>Pick</u>. A filling yarn or thread that runs crosswise in woven goods.

<u>Pile</u>. The cut or uncut loops which make the surface a pile fabric. Some common pile fabrics include velvet, corduroy, terry toweling, furniture covering, and rugs and carpets.

<u>Ply</u>. The number of single yarns twisted together to make a composite yarn. When applied to cloth, it means the number of layers of fabric combined to give the composite fabric.

<u>Point</u>. A term used in quoting the price of raw cotton. One point is equal to 1/100 of a cent.

<u>Price</u>, raw cotton. There are several different cotton price series, each of which represents a different time and space dimension in the market. All price series, ranging from U.S. farm prices to international prices, are linked by common fundamental demand and supply factors.

Farm price. The season-average price received by farmers for cotton is a sales-weighted average of prices received by farmers during the marketing season at the point of first sale, usually on the farm or at a local delivery point. This USDA series is available for both upland cotton by months and by State and for ELS cotton by marketing year and by State and is reported in <u>Agricultural Prices</u>, published by USDA's National Agricultural Statistics Service. An important use of upland cotton farm prices on a calendar year basis is to determine Government deficiency payments.

Futures price. The current price of cotton established at a futures exchange to be delivered at some future date. Futures contracts are primarily traded by merchants to hedge their price risks but are also used by growers, mills, and others to reduce risks of adverse price movements. The so-called No. 2 contract, covering SLM white 1-1/16-inch cotton, is traded daily on the New York Cotton Exchange. The Chicago Rice and Cotton Exchange's short staple cotton futures contract covers SLM Light Spotted 31/32-inch cotton.

International price. There is no statistically valid, single estimate of a world price. Two popular measures are reported by Cotlook, Ltd., Liverpool, England, publishers of Cotton Outlook. The Outlook "A" index is a simple arithmetic average of the five lowest priced growths of the 11 quoted for Middling 1-3/32-inch cotton delivered to northern Europe from various exporting countries. The "B" index is a simple

average of the three lowest northern European prices of the six quoted for shorter staple coarse cotton varying in staple length from 1 inch to 1-3/32 inches. These prices are used to compare export competitiveness of American and foreign growths.

Mill price. The price for cotton delivered to mills in western North Carolina and South Carolina is commonly referred to as Group B mill price. These prices, including landing and brokerage costs, are quoted for cotton of given grades and staples from given regions. The SLM 1-1/16-inch price is often compared with polyester staple and rayon staple prices to indicate cotton's competitive position in the raw fiber market.

Spot price. A spot or cash market price represents the price for which cotton of various qualities was sold at warehouse locations in seven market areas designated by the Secretary of Agriculture. Spot market quotations are published daily by the Agricultural Marketing Service from price quotations furnished by cotton buyers. Spot prices are used to establish premiums and discounts for the Government's cotton loans to producers and for settling futures contracts. The spot market price also represents the market value of cotton in the early stages of the wholesale marketing chain.

Price support. Government price support programs for cotton and other farm commodities are administered by USDA's Agricultural Stabilization and Conservation Service. Various methods of supporting producers' price have been used over the years. Support has commonly been achieved through nonrecourse loans, purchases, and payments at announced levels. Recent legislation is designed to make export commodities more competitive in world markets through market price support at or near world price levels. At the same time, producers' incomes are enhanced through deficiency payments. Export competitiveness is further enhanced by issuing marketing certificates to first handlers if world prices fall below producers' loan repayment levels.

<u>Producer</u>. A person who, as owner, landlord, tenant, or sharecropper, is entitled to a share of the crops available for marketing from the farm or a share of the proceeds.

<u>Program (agricultural)</u>. Government activities aimed at accomplishing a certain result. Such activities include agricultural price support loans, purchases and payments, commodity storage, transportation, exports, and acreage reduction.

<u>Program costs</u>. No single definition is applicable to all uses. Program costs may be gross or net expenditures of the CCC on a commodity during a fiscal year or other period. Program costs may be the realized loss on disposition of a commodity, plus other related net costs during a fiscal year or other period. Program costs may be the net costs attributed to a particular

year's crop of a commodity during the marketing year for that commodity.

<u>Public Law 480 (PL 480)</u>. The principal legislative authority for channeling U.S. food and fiber to needy countries. First enacted in 1954, PL 480 was extended by the Food for Peace Act of 1966 and subsequent legislation.

Quality. See cotton quality.

Raw fibers. Textile fibers in their natural state before any manufacturing activity has taken place; for example, cotton as it comes from the bale.

<u>Referendum</u>. The referral of a question to voters to be resolved by balloting; for example, marketing quotas, acreage reduction, or marketing agreements.

Residual supplier. A country which furnishes supplies to another country only after the latter has obtained all it can from other preferred sources.

Roving. An intermediate stage of yarn making between sliver and yarn; the last operation before spinning into yarn.

Running bale. Any bale of varying lint weight as it comes from the gin.

Sea Island. See cotton.

<u>Seed cotton</u>. The raw product which has been harvested but not ginned, containing the lint, seed, and foreign matter.

<u>Skip-row planting</u>. The practice of planting one or more rows in uniform space, then skipping one or more rows, to conserve moisture in dryland areas or to increase yields on land actually planted, or both.

<u>Sliver</u>. A strand or rope of fibers without twist. In yarn manufacture, a sliver is formed by the carding machine and is of greater diameter than roving.

<u>Soft fibers</u>. Flexible fibers of soft texture obtained from the inner bark of dicotyledonous plants. Soft fibers are fine enough to be made into fabrics and cordage. Examples are flax, hemp, jute, kenaf, and ramie. See hard fibers.

<u>Spinning</u>. The process of drawing fibers that may be in roving or rope form, twisting the appropriate number of turns per inch, and winding the yarn on a bobbin or other suitable holder.

Spinning quality. The ease with which fibers lend themselves to yarn-manufacturing processes.

Spot price. See price, raw cotton.

Staple fibers. (1) Natural fibers whose length usually ranges from about 1 inch to 1-1/2 inches, such as cotton. (2) Manmade fibers which have been cut to the length of the various natural fibers to facilitate blending and further processing with other fibers.

Strict Low Middling 1-1/16-inch cotton. The grade and staple length used as the basis on which the CCC establishes its loan rates. Higher qualities receive loan premiums and generally higher market prices, while lower qualities receive lower loan rates and lower prices. See cotton quality.

<u>Supima</u>. Trademark of an ELS cotton, commonly referred to as American Pima cotton, produced in Arizona, New Mexico, and west Texas. Supima Association of America is a producer association headquartered in Phoenix, AZ.

<u>Synthetic fibers</u>. Fibers made from petroleum-derived chemicals that were never fibrous in form. They are categorized as noncellulosic fibers.

Tare. The weight of the ties (or bands) and wrapping materials that contain the bale of cotton. The quoted net weight of a bale excludes the tare, whereas the gross weight includes tare.

<u>Tex</u>. A system of yarn numbering that measures the weight in grams of 1,000 meters of yarn. A 30-tex yarn weighs 30 grams per 1,000 meters.

<u>Texture</u>. The number of warp threads (ends) and filling yarn (picks) per square inch in a woven fabric. For example, 88x72 means there are 88 ends and 72 picks per square inch in the fabric.

<u>Textile</u>. Any product made from fibers, including yarns, fabrics, and end-use products such as apparel, home furnishings, and industrial applications.

<u>Twist</u>. The number of turns per unit of length of the fiber, strand, roving, or yarn. In the United States, twist is measured in terms of the number of turns per inch.

<u>Universal density bale</u>. A bale of cotton compressed to a density of 28 pounds per cubic foot.

<u>Upland cotton</u>. See cotton.

<u>Warp</u>. The yarns that run lengthwise in a woven or warp-knit fabric.

<u>Wash and wear</u>. A term applied to any garment which can be washed, dried, and then worn again with little or no ironing. Also called "durable press" or "permanent press."

<u>Weft</u>. The filling yarns that run crosswise in woven fabric or weft-knit fabric.

<u>Weight of fabric</u>. Three methods are used to measure fabric weight: (1) linear yards per pound, (2) ounces per linear yard, and (3) ounces per square yard.

<u>World price</u>. Often refers to the c.i.f. price of an imported agricultural commodity at the principal port of importation of a major importing country or area. See prices, raw cotton.

<u>Woven fabric</u>. Fabric made by interlacing two sets of yarn at right angles. The warp yarns run lengthwise in the fabric; the filling (weft) yarns are passed over and under the warp yarns.

<u>Yarn</u>. A continuous strand of twisted (spun) fibers of any kind and of varying staple length, usually used in the weaving or knitting of fabric.

Yarn size. Yarns, or threads, are numbered according to weight. The higher numbers denote fiber fineness. A "1s" cotton yarn has 840 yards in a pound; a "30s" cotton yarn has 25,200 yards in a pound. A "30/2" is a two-ply yarn containing two strands of 30s. See cotton count.

continued --

Footnotes Appendix table 3.

- --- = Not applicable.
  - $\underline{1}$ / Crop year beginning August 1.
- $\underline{2}$ / Includes ending stocks (July 31) of cotton in consuming establishments, public storage (including cotton under loan but excluding CCC-owned cotton), compresses, and cotton in transit.
- 3/ Season-average prices received by farmers for lint cotton, including an allowance for unredeemed loans.
- 4/ Loan rates shown for 1950-73 are basis Middling 1-inch, micronaire 3.5-4.9. Loan rates shown for 1974-85 are basis Strict Low Middling 1-1/16 inch, micronaire 3.5-4.9.
- 5/ From 1964-70, price support payments were available on the domestic allotment (67 percent of total allotment in 1964, 65 percent in 1965-70). Loans were available on the entire production within the allotment.
- $\underline{6}/$  From 1971-73, the direct payment represents the minimum payment rate available on the full base acreage allotment. Payments in 1971-72 were contingent on participation in the cropland set-aside program, while no set-aside requirement was imposed for 1973.
- 7/ From 1974-85, the direct payments represent deficiency payments: the difference between the target price and the higher of the calendar year average price or the base loan rate. Diversion payments, disaster payments, and payment-in-kind entitlements are excluded.

<sup>--- =</sup> Not applicable (no outlays).

<sup>1/</sup> Excludes PL 480 commodity costs.

<sup>2</sup>/ Direct price support or deficiency, diversion, or disaster payments plus Government expenditures on transportation, classing, loans, loan settlements, and other expenses less sale proceeds, loan repayments, and other receipts. Negative indicates net receipts.

<sup>3</sup>/ Includes July-Sept. 1976 to allow for shift from July/June to Oct./Sept. fiscal year.

<sup>4/</sup> Net receipts of less than \$1 million.

<sup>5</sup>/ Less than \$50,000.

/ Loan values per harvested acre obtained by multiplying appropriate base loan rates per pound (from appendix table 3) by average yields per harvested acre. 2/ Current dollars deflated by the GNP implicit price deflator (1972 = 100). 3/ Gross value of production of upland cotton lint and seed, divided by harvested acres. Excludes Government payments. 4/ Total value of upland cotton lint and seed produced, excluding Government payments. The value of cottonseed produced averaged abut 13 percent of the total value of lint and seed in 1974-83.

Footnotes for appendix table 7--Provisions of upland cotton programs.

Abbreviations used are as follows: AF = allocation factor, AWP = adjusted world price, Ba = base acres, CC = carrying charges, Div = diverted acres, Def = deficiency payment, Dom = domestic allotment, NA = not applicable, PIK = payment-in-kind, Plt = planted acres, Yld = yield.

- 1/ Deficiency payment is the difference between the target price and the higher of the calendar year average market price received by farmers or the loan rate. Starting in 1986, eligible producers who agreed to forego CCC loans may receive loan deficiency payments on their production otherwise eligible for loan, not to exceed the farm program acreage times the farm program payment yield. The loan deficiency payment rate is equal to the difference between the loan rate and the loan repayment rate. Up to one-half of the loan deficiency payment may be made in negotiable marketing certificates. Loan deficiency payments are subject to the overall \$250,000 payment limitation.
- 2/ The allocation factor, ranging from 80 to 100, is determined by dividing national program acres by number of acres harvested.
- 3/ This is the national average loan rate. Prior to 1961, support was based on Middling 7/8 inch cotton. Loans shown for 1961 through 1973 are basis Middling 1 inch, micronaire 3.5 through 4.9. Loans shown for 1974 through 1989 are basis Strict Low Middling 1-1/16 inch, micronaire 3.5 through 4.9. Prior to 1971, loans were on a gross weight basis. Since then, loans have been based on net weight at average location. Under the 1985 Act, the loan rate is determined by the legislated formula (lower of 85 percent of the average spot market price for Strict Low Middling 1-1/16 inch upland cotton (micronaire 3.5-4.9) at average U.S. location during the 5 preceding years, excluding the high and the low or 90 percent of the average of the 5 lowest priced growths among the growths quoted for Middling 1-3/32 inch cotton, c.i.f. northern Europe, adjusted downward by the average difference between the northern Europe prices and the U.S. spot market prices of SLM 1-1/16 cotton)
- 4/ If the Secretary determines that the adjusted world price is below the loan rate, then the Secretary has the authority, as granted by the 1985 Act, to implement either Plan A or Plan B for the repayment of loans. Under Plan A, the Secretary announces a loan repayment rate of 80-100 percent of the loan rate, which may not be changed subsequent to announcement. Under Plan B, the loan repayment rate is the lower of the loan rate or the current adjusted world price.
  - 5/ Sales made at fixed prices or through competitive bids.
- 6/ In any event, the CCC cannot sell stockholdings for less than the going market price. In many years the announced minimum price was higher than the legislated minimum price.

  - 7/ Simple average of actual sales.
    8/ Producer must maintain soil conserving base in addition to planting diverted acres to conserving uses.
  - 9/ Producer must be in compliance with programs for all program crops planted on the farm.
- 10/ Producer must be in compliance with upland cotton program requirements on other farms either owned or with an interest in.
- 11/ When marketing quotas are in effect, a farmer who does not comply with the cotton acreage allotment established for the kind of cotton grown on the farm is subject to a penalty on the farm marketing excess. The cotton crop from the farm is also ineligible for price support under CCC programs. Each type of cotton is treated independently. Extra long staple cotton cannot be substituted for upland cotton or visa versa.
- 12/ Marketing quota penalty rate for upland cotton is 50 percent of the parity price effective as of June 15 of the calendar year in which the cotton is produced.
- 13/ Includes acres allocated from the national acreage reserve provided to take care of minimum farm allotments as provided by cotton legislation.
  - 14/ Bad weather or unavoidable hazard.
- 15/ Payment by CCC sight draft or payment-in-kind certificate at the election of the producer available on domestic allotment.
- 16/ Farmers who plant export acreage are not eligible for the additional price support payment. Export cotton is not eligible for price support loan. However, the amount of cotton represented by the farm yield times the acres in the effective farm allotment is eligible for the regular price support loan.
  - 17/ Producer cannot exceed feed grain base.
  - 18/ Payment is available only on planted acreage if less than 90 percent of the allotment is planted.
  - 19/ All cotton produced on farms receiving export acreage must be exported.
- 20/ If flood, drought, or other natural disaster conditions make it impossible for a farm operator to plant cotton on a participating farm, the ASC county committee determines the acreage that would have been planted on the farm and payments are made on that basis, provided the acreage is not planted to an income producing crop.
- 21/ The term of the loan is 10 months from the first day of the month which the loan is made. In prior years, the loan maturity date was July 31 following the year in which the cotton was produced.
- 22/ Preliminary payment rate. The final payment rate is equal to the difference between the parity price for upland cotton as of August 1 and the average market price for Middling 1-inch upland cotton, micronaire 3.5-4.9 in the designated spot market during the first 5 months of the marketing year (August 1). No refund of this payment is required in the event the final payment rate calculates at less than 15 cents.
- 23/ If 90 percent or more of the allotment is planted, the entire allotment is considered as planted for payment purposes.
- 24/ A producer who plants less than 90 percent of the cotton acreage allotment will lose a portion of it the following year equivalent to the percentage underplanted up to 20 percent. After 3 consecutive years of

zero planting, the entire allotment would be removed. Allotment acreage not planted because of natural disaster or a condition beyond the control of the producer will be regarded as planted.

- 25/ Limitation does not include loans or purchases per person per commodity (cotton, wheat, feed grain).
- 26/ Limitation on total payments to eligible upland cotton, wheat, and feed grain producers per person. Does not include loans.
- 27/ The loan period is 10 months, but producers have the option, during the 10th month, of extending the loan for an additional 8 months whenever the spot market average price in the preceding month is 130 percent or less of the average for the previous 36 months.
  - 28/ Voluntary set-aside requirement applies to previous year's plantings.
- 29/ Producers must assure that the NCA is not exceeded on nonparticipating farms they own or operate that produce a set-aside crop.
- 30/ Limitation on total payments to eligible upland cotton, wheat, feed grain, and rice producers per person. Does not include loans or disaster payments.
- 31/ Limitation on total disaster payments under the upland cotton, wheat, feed grain, and rice programs per person.
- 32/ National program acres, allocation factors, and voluntary acreage reductions are not applicable when an acreage reduction is in effect.
- 33/ Beginning with 1982 crops, disaster payments were made only to upland cotton producers to whom Federal crop insurance is unavailable. However, at the Secretary's discretion disaster emergency assistance may be paid to producers when conditions are too serious to be relieved by crop insurance or other Federal aid.
- 34/ Farmers complying with the 20-percent acreage reduction program are also eligible to participate in the payment-in-kind program. Producers can receive payment-in-kind either by reducing their planted acreage by an additional 10-30 percent of the base or by bidding to remove their entire bases from production.
- 35/ For the whole base bid program, payment is made on the entire base times the percent of the accepted bid times the farm program payment yield. Bids were evaluated on a comparative basis within each county with the restriction that total acreage removed from production under the combined acreage reduction and the payment-in-kind could not exceed 45 percent of that county's cotton acreage base.
- 36/ Advanced deficiency payments are made at half the projected rate. Advanced diversion payments are made at half the diversion payment rate.
  - 37/ All cash payments subject to reductions of 4.3%, Gramm-Rudman-Hollings Act.
- 38/ Under the 50-92 rule, growers who plant between 50 and 92 percent of the permitted acreage to upland cotton and devote the remaining permitted acres to a conserving use are eligible to receive deficiency payments on 92 percent of the permitted acreage.
- 39/ Any producers whose 1986 program yield is reduced below 97 percent of their 1985 program yield received deficiency payments in the form of cotton certificates (called "additional yield certificates") sufficient to guarantee a return equal to 97 percent of their 1985 program yield.
- 40/ Limitation on total payments to eligible upland cotton, wheat, feed grain, rice, and extra long staple cotton producers per person. The limitation does not apply to loans, purchases, loan deficiency payments, first handler certificates, or inventory protection certificates or deficiency payments resulting from the lowering the basic (statutory) loan rate for wheat and feed grain.
- 41/ To be eligible for loans, purchases, and payments for wheat, feed grains, upland cotton, or rice, the acreage planted for harvest on a farm to other program crops, excluding extra long staple cotton and oats, may not exceed the crop acreage bases of those crops.
- 42/ Any producers, whose 1987 program yield is reduced below 95 percent of their 1985 program yield, received deficiency payments in the form of cotton certificates (called "additional yield certificates") sufficient to guarantee a return equal to 95 percent of their 1985 program yield.
- 43/ The total of the following payments, combined with the total deficiency and diversion payments, is limited to \$250,000 per person: (1) disaster payments; (2) gain realized by repayment of a loan at a lower level than the original loan level; (3) any deficiency payment for wheat or feed grains attributed to a reduction in the statutory loan rate; (4) any loan deficiency payment; (5) any inventory reduction payment; and (6) any payment representing compensation for resource adjustment or public access for recreation.
- 44/ At signup, participants may request 30 percent (half in cash and half in generic certificates) of their projected 1987 deficiency payments.
- 45/ Total deficiency and diversion payments under the wheat, feed grain, upland cotton, extra long staple cotton, and rice programs are limited to \$50,000 per person.
- 46/ Any producers whose 1988 program yield is reduced below 90 percent of their 1985 program yield will receive deficiency payments in the form of cotton certificates (called "additional yield certificates") sufficient to guarantee a return equal to 90 percent of their 1985 program yield.
- 47/ At signup, participants may request 40 percent (half in cash and half in generic certificates) of their projected 1988 deficiency payments.
- 48/ At signup, participants may request 30 percent of their projected 1989 deficiency payments in cash and after May 15, 1989, an additional 10 percent in generic certificates.
